

# HORUS

## FLIGHT HELMET SYSTEM

### ANR – H77

#### Active Noise Reduction System

Noise can create stress for pilots and disrupt cockpit communication. Our headsets offer clear audio and effective noise reduction, and they can connect to smartphones or tablets. We prioritize high performance in our products while aiming to reproduce music as accurately as possible, avoiding exaggerated bass or treble sounds that may appeal to beginners but lack authenticity.

#### KEY FEATURES

##### ACTIVE NOISE REDUCTION

HORUS ANR System is an active headset capable of isolating, offsetting and cancelling noise. While noisy situations may necessitate its use, it offers a quieter and more comfortable experience by reducing background noise. It significantly reduces outside noise compared to a standard headset allowing the pilot to fly more comfortably in the aircraft.

##### BLUETOOTH / WIRELESS COMMUNICATION

The Horus Active Noise Reduction System features Bluetooth and wireless connections for seamless, cable-free audio, enhancing noise cancellation and sound quality for any environment.

##### IMPEDANCE OPTION

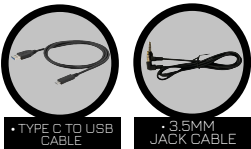

Horus Active Noise Reduction System offers both high and low impedance options, ensuring compatibility with a variety of audio devices and allowing users to achieve optimal sound quality tailored to their needs.

##### BATTERY EFFICIENT

The Horus Active Noise Reduction System is designed to be battery efficient, providing extended usage time while maintaining optimal performance, so you can enjoy clear audio and noise cancellation without frequent recharging.
